

The global climate debate has been a constant theme in politics, business and the media in recent years. Given the growing need for more environmental protection and resource conservation by the general population, many companies are also thinking about how to base the development and manufacture of their products on sustainability.

The demand for energy and raw materials continues to grow, as well as the awareness among the population about the depletion of fossil resources. Renewable resources are therefore in the focus, not only as alternative energy sources but also as sources for raw materials.

Against this background, the production and use of bioplastics is becoming increasingly important. This contrasts with a large information deficit concerning this group of materials, except among experts. We present various aspects relative to this topic, in order to facilitate your entry into the world of bioplastics. Take advantage of our menu in order to get information about this field.
